commonscore social oracle for milestone-based financing

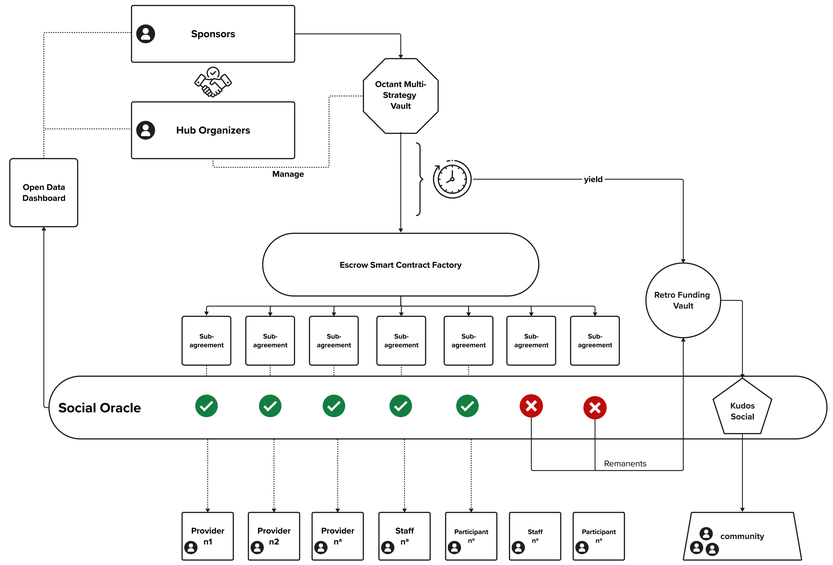
A) Social Oracle: is the aggregated set of human attestations that confirm whether a commitment was honored (e.g., catering delivered on time and quantity; venue open and functional; participant milestone achieved).

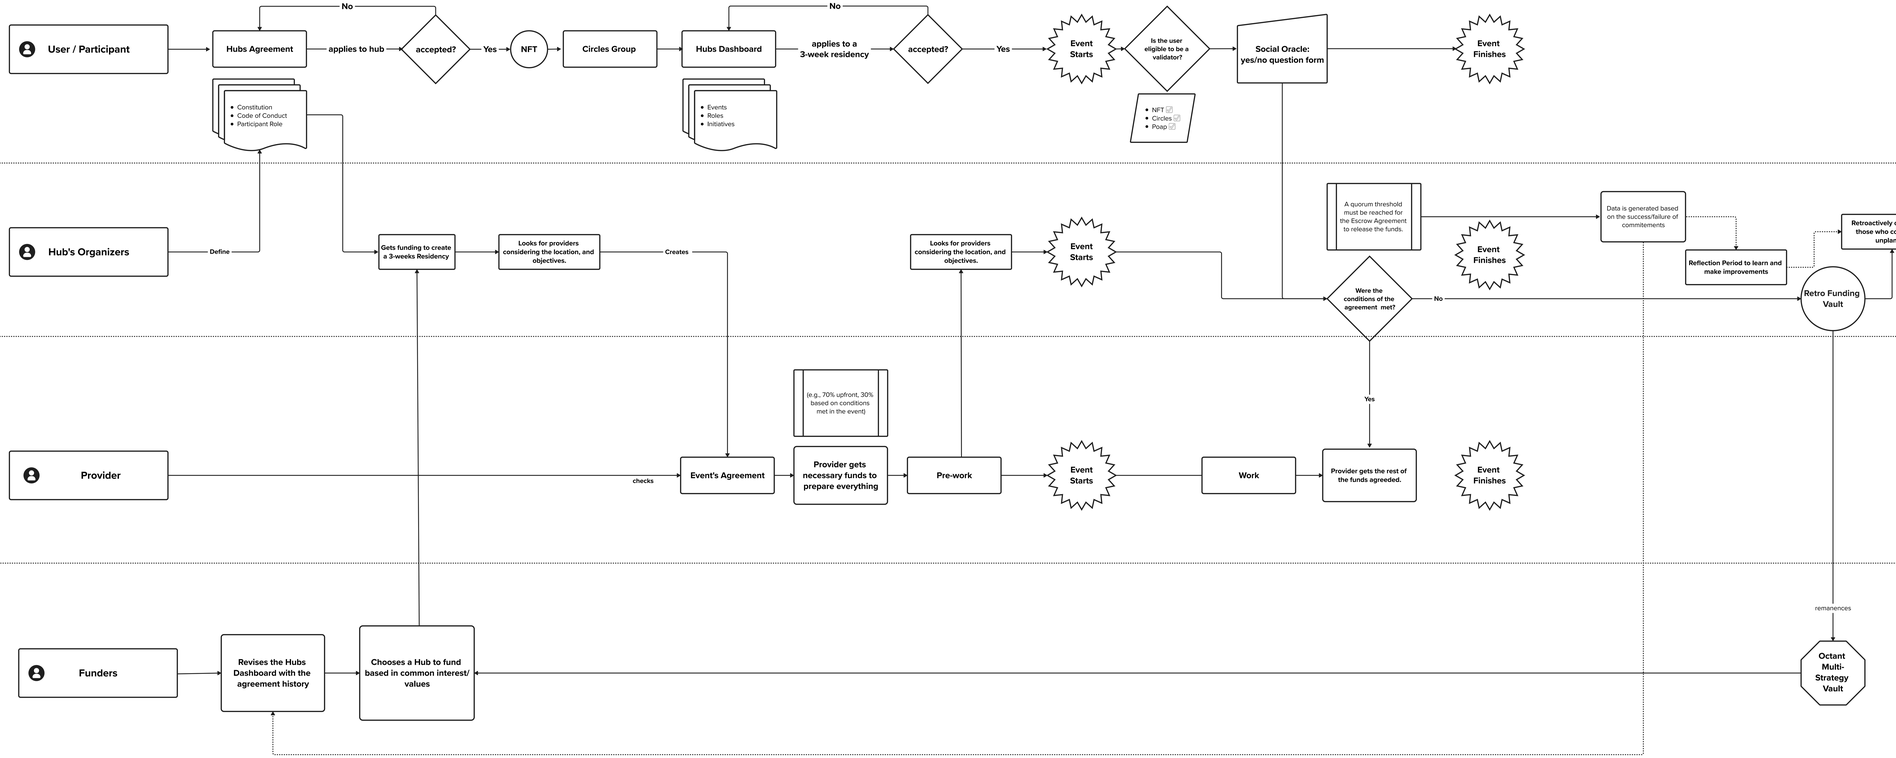
This signal becomes a hard precondition for fund release. The oracle is not a subjective narrative; it is a structured, signer-scoped, and schema-bound data flow that the contract verifies.

B) Factory Smart Contract: A minimal factory contract deploys parameterized EscrowAgreement instances.

Factory responsibilities:
(i) Register the root program (hub, sponsor, budget, deadlines, oracle parameters).
(ii) Deploy child EscrowAgreement contracts with their own payment schedule and quorum rules.
(iii) Emit events for indexers/dashboards.

C) Retro Vault: A program-scoped RetroVault serves as the sink for conditional funds that were not released (missed quorum, deadline, or cancellation). Sponsors may also pre-allocate a percentage directly to the RetroVault at program start.





Randomized Selection: a pseudo-random subset is selected for each validation round.
